HOOKATHON BRAINSTORM GUIDE

Sustainable Liquidity & MEV Protection

While we wait a second to get started, register for the UHI10 Demo Day on Luma!

HOOKATHON

August 17 - September 3

DEMO DAY

September 11th

FORMAT

8-slide field guide

AUDIENCE

UHI10 cohort builders

- THEME OVERVIEW

Turn Uniswap into a **fair-flow AMM layer** for volatile pairs.

UHI10 is about hooks that protect LP's from MEV and sandwich attacks while making volatile-pair liquidity sustainable at low fees. Neutralize the attack. Recapture the value. Beat Aerodrome on the pairs that matter most.

// THE FIVE OPEN PROBLEMS

01

LPs lose value to sandwich attacks and toxic order flow, especially on volatile pairs.

02

Arbitrageurs extract loss-versus-rebalancing (LVR) value that never reaches LPs.

03

Dynamic fees alone can't distinguish "good" retail flow from "bad" toxic flow.

04

Public mempools and predictable ordering make transactions easy to front-run.

05

Private orderflow systems (CoW, Flashbots Protect) sit off to the side of Uniswap.

● **THEME OVERVIEW**

Official Prompt Examples direct from Uniswap.

01

Hooks that randomize swap ordering or delay callbacks to neutralize sandwiching

02

Time-weighted execution windows or probabilistic settlement hooks

03

Fee-rebate systems tied to order flow quality

04

Hybrid routing between private orderflow systems (CoW, Flashbots Protect) and Uniswap

05

Protocol-native MEV auction hooks where LPs recapture a share of extracted value

- PAST COHORTS

Five precedents across the fair-flow design space.

Pulled straight from the internal Hook Directory. Study the mechanism, not just the pitch.

UHI6

LVR Auction Hook

Auctions first-in-block trading rights via EigenLayer AVS and redistributes arbitrage profit to LPs.

Auctions • LVR

UHI7

AsyncSwapHook

Randomized 24–84 second execution delay on large swaps, breaking sandwich-bot timing.

Ordering • Delay

UHI8

Glyph

Cross-pool reputation registry that reprices known extractors up to 33x, paying the premium to LPs.

Reputation • Fee Rebate

UHI2

CoWSwap

Matches coincidence-of-wants orders off-chain, falling back to the AMM when no match is found.

Cow • Private Matching

UHI8

Tidehook

Dual-market router that segments retail from whale trades, shielding LPs from toxic flow.

Flow Segmentation

- NOT YET ATTEMPTED

Four ideas no one has built — yet.

After searching all 660 submissions across UHI1–UHI9 by name, description, tags, and integrations, these four returned zero relevant matches.

★ WHITE SPACE

01

Probabilistic Settlement Hook

Settle at one of several pre-committed prices via VRF, so searchers can't precompute the exact fill price.

→ VRF • RANDOM SETTLEMENT

02

Builder-Attested Flow Hook

Read block-builder attestations about ordering fairness and gate a fee rebate on attested-fair paths.

→ UNICHAIN • BUILDER-AWARE

03

Searcher Bonding Hook

Searchers post a bond for priority access; slashing funds an LP-facing insurance pot for sandwich attempts.

→ BONDING • SLASHING

04

LP-Governed MEV Auction Hook

LPs vote per pool on the auction mechanism and revenue split applied to their own liquidity.

→ GOVERNANCE • PER-POOL

- TRIED RARELY

Six directions touched, never nailed for this cohort's sponsors.

- A FEW ATTEMPTS

Existing attempts are complex, partial, or built on the wrong sponsor stack. Each is a real opening to ship something cleaner — or integrate with this cohort's actual sponsors.

01 Commit-Reveal / Delay Ordering

18 submissions across 9 cohorts use randomized delay or commit-reveal to break sandwich timing.

→ TRIED 18× · ASYNCSWAPHOOK, ZEANHOOK

02 CoW-Style Matching + AMM Fallback

17 attempts match orders privately first; none integrate the real CoW Protocol or Flashbots Protect.

→ TRIED 17× · COWSWAP, INTENTPOOL

03 Batch-Clearing Settlement

A handful of Angstrom-style batch auctions exist, but none live inside the incubator as a clean, auditable hook.

→ TRIED ~5× · UNIASS, VEILEDBATCH

04 Retail vs. Whale Segmentation

Only one team has routed retail and whale flow differently to shield LPs from toxic size.

→ TRIED 1× · TIDEHOOK

05 Volatility-Scaled Delay Length

Past delay hooks use a fixed window. Tying delay length to real-time volatility is untried.

→ TRIED 0-1× · ASYNCSWAPHOOK (FIXED)

06 Cross-Venue LVR Recapture

51 submissions target cross-chain LVR, almost all via Reactive Network — a true cross-venue (CEX/DEX) version is thin.

→ TRIED INDIRECTLY · ARBSHIELD

- KEY TAKEAWAYS

Three things to carry into your scoping session.

AVOID

01

FHE dark pools & LVR auctions are over-built.

73 FHE/dark-pool submissions and 53 LVR-auction submissions — 19 in UHI9 alone. Need a sharp mechanism or sponsor differentiator.

AIM FOR

02

Real partner integrations.

None of 660 past submissions integrate Flashbots, CoW Protocol, Aegis, Skip, Anoma, or Osmosis. A genuine integration is close to guaranteed differentiation.

WIN CONDITION

03

Combine defense and recapture.

Ordering protection alone is a shield. Auction-based recapture alone is a redistribution. Pair them for the strongest pitch.

● THREE WEEKS TO SHIP

Find your angle.

Go build.
